

**EX.NO-13****LOGISTIC REGRESSION****Aim:**

To implement model evaluation technique to get test score of a supervised learning algorithm

**Description:**

1. Use of Logistic Regression model for model evaluation
2. The given built in data set, can be split into training set and test set
3. Evaluate the model through its test score

**Program:**

```
from sklearn.linear_model import
LogisticRegressionfrom sklearn.model_selection
import train_test_split from sklearn.datasets
import make_blobs

# create a synthetic dataset
X, y = make_blobs(random_state=0)

# split data and labels into a training and a test set
X_train, X_test, y_train, y_test = train_test_split(X, y, random_state=0)

# instantiate a model and fit it to the training
set logreg = LogisticRegression().fit(X_train,
y_train)

# evaluate the model on the test set
print("Test set score: {:.2f}".format(logreg.score(X_test, y_test)))
```

**Output:**

Test set score:0.88

**Result:**

The programs were run successfully
